FLASHING

FLASHING WARNING

TOTAL LEAD TIME: 1,860.83s

Value-Added (VA): 159.91s (8.59%)

Pure Non-Value-Added Waste (NVA): 1,356.12s (72.88%)

BNVA: 344.80s (18.53%)

Pure Non-Value-Added Waste (NVA): 1,356.12s (72.88%)

Lap 01-03: 09:21.59

Capturing entry and kiosk freeze.

Lap 04-06: 16:43.52

Capturing prep and table waiting.

Final Split: 31:01.98

Handoff reconciliation.

FIELD FAILURES: THE FRICTION OF ENTRY & ORDERING

ENTRY CONGESTION - BOTTLENECK 5

External walk-up window bundles cash handling, bagging, and ice-cream dispensing.

Takeaway queues spill into the main entrance, creating 134.44s of BNVA security frisking delays.

KIOSK UI SOFTWARE LATENCY - BOTTLENECK 1

Inadequate processor headroom and non-persisted cart sessions.

Payment timeout forces customer to a new kiosk, resulting in 426.46s of NVA rework before the kitchen even receives the ticket.

INFORMATION ASYMMETRY & THE KITCHEN BLINDSPOT (BOTTLENECK 4)

PHYSICAL ANCHOR

DIGITAL BLINDSPOT

The KDS shows Tent #51 buried in a Zone 5 backlog (11:18 min), with older tickets aging beyond 47 minutes. Critical failure: No automated supervisory escalation triggers, no runner dispatch alerts, and zero status transparency for the customer, inducing dining room crowd migration.

SPATIAL DISCONNECT & RESOURCE STARVATION

Step 1: Passive BLE hardware lacks active runner dispatch. Food sits cooling for **15m 09s.**

Dual-Role Starvation Loop

Step 2: To clear the staging backlog, the barista is forced into a dual-role to roam the dining room and deliver food.

Step 3: The Starvation Loop. The moment the barista walks away, the espresso machine stops. High-margin beverage production halts, starving the expeditor tray.

DIAGNOSTIC CONCLUSION: The absence of dedicated food runners forces skilled production staff (barista) into into low-value transport roles, creating an immediate halt in high-margin beverage throughput and a perpetual cycle of resource starvation.

THE ANATOMY OF AN OPERATIONAL COLLAPSE

UI Failure: POS drop delays order entry **(+426s NVA).**

Information Asymmetry: KDS lacks escalation, hiding the **47-minute backlog.**

Hardware Disconnect: Passive BLE fails to trigger runner dispatch.

Role Bundling: Barista abandons station to deliver food, **halting production.**

The 159.91s of pure Value-Added food prep is crushed under the weight of an uncoordinated, fragmented system architecture. The problem is not lazy workers; it is systemic structural misalignment.

TO-BE ARCHITECTURE: SYNCHRONIZED PULL-BASED FLOW

Target Lead Time: ≤ 225.00 s (3 min 45 s) | Projected PCE: $\geq 45.0\%$

DECOUPLING PRODUCTION FROM DELIVERY (THE ZERO-ROAMING RULE)

AS-IS (FRAGMENTED FLOW)

Barista brews AND delivers. Results in **high machine idle time** and **queue backlog**.

TO-BE (THE ZERO-ROAMING RULE)

Decoupling production from delivery. Baristas remain stationed, **maximizing specialized labor utilization** and ensuring **continuous, high-margin throughput**.

DIGITAL ENABLEMENT STACK

The ROI of Redesign: KPI Transformation Matrix

Metric	As-Is Baseline	To-Be Target Benchmark
Process Cycle Efficiency (PCE)	8.59%	>= 45.0%
Total Customer Lead Time	1,860.83 s (31.0 min)	<= 225 s (3.75 min)
Kiosk Order Completion	426.46 s	<= 60.0 s
McCafé Station Utilization	~35% (Intermittent)	>= 80.0%
Staging Tray Dwell Time	909.21 s (15.1 min)	<= 30.0 s

RESTORING STRATEGIC HARMONY

SPEED:
Lead times
compressed
back under
4 minutes,
restoring the
core QSR value
proposition.

COST:
Zero-roaming
rule maximizes
specialized labor
utilization and
high-margin
beverage
throughput.

QUALITY:
Slashing staging
dwell time from
15m to 30s
preserves
temperature
integrity and
freshness.

CONVENIENCE:
Active BLE
tracking and
instant RPA
payment failover
deliver a
frictionless
experience.

Strategy cannot succeed in the presence of disconnected process design. Targeted digital enablement eliminates 70% of process waste to deliver sustainable operational excellence.
